PAPER

**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

Art Unit: 1632

### DETAILED ACTION

Claim amendments filed on 09/09/2010 have entered.

Claims 2-25, 27, and 29-52 are cancelled. Claim 1 has been amended. Claims 1, 26, 28, and 53 are pending and currently under examination.

This application 10/807,897 filed on March 24, 2004 claims the benefit of 60/457,009 filed on 03/24/2003.

### *Claim Objections*

1. Previous objection of claim 1 objected to because of the recitation of limitation “the attenuated *Salmonella typhimurium* vector comprises and aroA<sup>-</sup> dam<sup>-</sup> *Salmonella typhimurium* strain” is ***withdrawn*** because the word “and” has been amended to “an”.

### *Claim Rejection - 35 USC § 103*

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claim 1 remains rejected under 35 U.S.C. 103(a) as being unpatentable over **Haupt et al.** (Haupt et al., The potential of DNA vaccination against tumor-associated antigens for anti-tumor therapy, *Exp Biol Med* (Maywood). 227(4):227-37, 2002) in view of **Gordan et al.** (Gordan et al.

Art Unit: 1632

Universal tumor antigens as targets for immunotherapy, *Cytotherapy*, 4(4):317-27, 2002; this reference has been cited in the office action mailed on 04/25/2008), **Andersen et al.** (Andersen et al., Spontaneous cytotoxic T-cell responses against survivin-derived MHC class I-restricted T-cell epitopes in situ as well as ex vivo in cancer patients, *Cancer Res.* 61(16):5964-8, 2001), **Luther et al.** (Luther et al., Differing activities of homeostatic chemokines CCL19, CCL21, and CXCL12 in lymphocyte and dendritic cell recruitment and lymphoid neogenesis, *J Immunol.* 169(1):424-33, 2002; this reference has been cited in the office action mailed on 07/06/2007), **Lu et al.** (US 5,733,760, issued 03/31/1998; this reference has been cited in the office action mailed on 04/25/2008), **Xiang et al.** (Xinag et al., Protective immunity against human carcinoembryonic antigen (CEA) induced by an oral DNA vaccine in CEA-transgenic mice, *Clin Cancer Res.* 7(3 Suppl):856s-864s, 2001), and **Dueger et al.** (Dueger et al. *Salmonella* DNA adenine methylase mutants elicit protective immune responses to homologous and heterologous serovars in chickens, *Infect Immun.* 69(12):7950-4, 2001). Applicant's arguments filed 09/09/2010 have been fully considered and they are not persuasive. Previous rejection is ***maintained*** for the reasons of record advanced on pages 6-14 of the office action mailed on 05/11/2010.

For the clarity and completeness of this office action, the rejection for the reasons of record advanced on pages 6-14 of the office action mailed on 05/11/2010 is reiterated below, with revisions addressing claim amendments filed on 09/09/2010.

Claim 1 filed on 09/09/2010 reads as follows: An oral DNA vaccine suitable for eliciting an immune response against cancer cells in a patient comprising a DNA construct operably encoding at least one survivin protein and one CCL21 cytokine in a pharmaceutically acceptable carrier; wherein the DNA construct is incorporated in an attenuated *Salmonella typhimurium*

Art Unit: 1632

vector that targets Peyer's patches in the gut, wherein the DNA vaccine induces a cytotoxic T-lymphocyte immune response against tumor cells when orally administered to the patient, and the attenuated *Salmonella typhimurium* vector comprises an aroA<sup>-</sup> dam<sup>-</sup> *Salmonella typhimurium* strain.

*Claim interpretations:* **(I)** The word/phrase “oral” and “suitable for eliciting an immune response against cancer cells in a patient” recited in the preamble of claim 1 is the intended use of claimed “DNA vaccine”, which is a product. For prior art rejection, the components of claimed product bear patentable weight whereas the intended use of the product bears limited, if any, patentable weight, See MPEP 2111.03. Intended use does not impart patentable weight to a product. MPEP 2111.03: Intended use recitations and other types of functional language cannot be entirely disregarded. However, in apparatus, article, and composition claims, intended use must result in a structural difference between the claimed invention and the prior art in order to patentably distinguish the claimed invention from the prior art. If the prior art structure is capable of performing the intended use, then it meets the claim. In a claim drawn to a process of making, the intended use must result in a manipulative difference as compared to the prior art. In re Casey 370 F.2d 576, 152 USPQ 235 (CCPA 1967); In re Otto, 312 F.2d 937, 938, 136 USPQ 458, 459, (CCPA 1963). **(II)** The phrase “a patient” of the limitation “an immune response against cancer cells in a patient” recited in independent claim 1 encompasses *any* patient cared by a physician for human patient or cared by a veterinarian for any non-human mammal. This interpretation **(i)** is based on the limitation “survivin protein comprises SEQ ID NO: 3” recited in dependent claims 26 and 53, and SEQ ID NO: 3 is a *mouse* survivin protein, and “the CCL21 cytokine comprises SEQ ID NO: 7” recited in dependent claims 28 and 53 and SEQ ID NO: 7 is a *mouse* CCL21 protein, and **(ii)** is consistent with the status of art at the time of filing as evident by the prior arts cited in this maintained rejection. **(III)** The phrase “immune response” of the limitation “an immune response against cancer cells in a patient” recited in independent claim 1 encompasses any immune response which comprises “a cytotoxic T-lymphocyte immune response” against tumor cells when orally administered to the patient. **(IV)** The limitation “induces a cytotoxic T-lymphocyte immune response against tumor cells *when* orally administered to the patient” recited in claim 1 encompasses **(i)** a comparison of level of a cytotoxic T-lymphocyte immune response in a patient between oral administration and any other

Art Unit: 1632

non-oral administration of the same DNA construct encoding at least a survivin protein and one CCL21 cytokine, and **(ii)** a comparison of level of a cytotoxic T-lymphocyte immune response between orally administered DNA construct encoding at least a surviving protein and one CCL21 cytokine and any other orally administered control DNA construct, which for instance includes DNA construct encoding survivin protein, but not encoding a CCL21 cytokine.

**Haupt et al.** teaches that by DNA vaccination for a human cancer patient (See left column, page 228, Haupt et al., 2002), antigen-specific cellular as well as humoral immune responses can be generated. The induction of specific immune responses directed against antigens expressed in tumor cells and displayed e.g., by MHC class I complexes can inhibit tumor growth and lead to tumor rejection (See abstract, Figure 1, Haupt et al., 2002). A common strategy to further enhance DNA-based immunization is to employ cytokine genes as adjuvants. (See Table 1, and right column, page 230, Haupt et al., 2002) by linking the cytokine gene directly to the DNA vaccine or inserting DNA coding for an immunomodulatory peptide of a cytokine (See left column, page 231, Haupt et al., 2002). As an example, Haupt et al. discloses that almost all of these carcinomas (i.e. a malignant tumor of epithelial origin) specifically express calcitonin, and calcitonin may represent a suitable target antigen for DNA vaccines. Haupt et al. shows that DNA immunization by gene gun with an expression plasmid encoding the human calcitonin precursor preprocalcitonin that enables induction of antigen-specific cellular and humoral immune responses in mice, and co-delivery of a plasmid encoding GM-CSF increases the efficacy of this DNA vaccine (See left column, page 233, Haupt et al., 2002).

**Figure 1.** Priming of immune responses against tumor cells by DNA vaccination. The direct inoculation of plasmid DNA encoding a tumor-associated antigen into host cells, including professional APC, leads to the *in vivo* synthesis of the encoded antigen. The intracellular protein is processed into peptides that associate with MHC class I molecules. The MHC class I-peptide complex is displayed on the cell surface where it can be recognized by CD8<sup>+</sup> T cells. *Once activated, CD8<sup>+</sup> T cells acquire cytotoxic functions and can specifically lyse cells expressing the target antigen.* The predominant cell type capable of inducing T cells to become effector cells that can recognize and kill tumor cells following DNA immunization are bone marrow-derived APC. The CD28 molecule on the T cell membrane can interact with costimulatory molecules like B7-1 on APC. Lysis of transfected cells expressing the antigen or secretion of the antigen lead to the release of protein, which is taken up by APC. Internalized into lysosomes, the antigen is proteolytically degraded into peptides that associate with MHC class II molecules. *The MHC*

Art Unit: 1632

*class II-peptide complexes travel to the cell surface of APC where they can be recognized by CD4<sup>+</sup> T cells. These cells secrete **cytokines** that may facilitate tumor cell destruction in the effector phase of immune responses following DNA vaccination.* Tumor-specific CD4<sup>+</sup> cells not only provide help for the induction of specific CD8<sup>+</sup> CTL, but may also be critical in activating macrophages and eosinophils to produce nitric oxide and superoxides that participate in the destruction of tumor cells.

Haupt et al. does not explicitly teach **(i)** survivin as a tumor specific antigen, **(ii)** CCL21 as a cytokine that enhance T cell mediated immune response, or **(iii)** a DNA construct been incorporated in an attenuated *Salmonella typhimurium* vector that targets Peyer's patches in the gut, and the attenuated *Salmonella typhimurium* vector comprises an aroA<sup>-</sup> dam<sup>-</sup> *Salmonella typhimurium* strain.

However, at the time of filing of instant application, the art taught that **(i)** universal tumor antigens, including human survivin, expressed in all tumors but not expressed in non-cancerous tissue, can be used as targets immunotherapy, and **(ii)** the tumor cell specific immune response can be enhanced by the presence of various cytokines (See, for instance, second paragraph, right column of page 118, Gordan et al., 2002). Furthermore, **(iii)** the advantages of a vaccine comprising attenuated *Salmonella typhimurium* as a vector to express exogenous antigen(s) that can be delivered orally for vaccination and targets Peyer's patches in the gut, and the attenuated *Salmonella typhimurium* vector comprises an aroA<sup>-</sup> dam<sup>-</sup> *Salmonella typhimurium* strain, are also known in the art.

**(i)** Regarding survivin being a universal tumor associated antigens as targets for immunotherapy, **Gordan et al.** teaches that the cardinal feature of universal tumor associated antigen (TAA, also known as tumor specific antigen) is that they are expressed in nearly all

Art Unit: 1632

tumors but not expressed in non-cancerous tissue, and they are directly involved in the malignant phenotype of the tumor. Gordan et al. teaches that certain peptides derived from such Ags are expressed on the tumor-cell surface, as evidenced by Ag-specific, MHC-restricted T-cell anti-tumor reactivity. Gordan et al. also teaches that four examples (i.e. a definitive number) of universal tumor Ags (hTERT, CYP1B1, survivin, and MDM2; see left column page 321 and Table 1 page 3232), each at various levels of preclinical and clinical development. Gordan et al. further teaches that features of universal TAA indicate a pre-existing, high-affinity T-cell pool that can be activated *in vivo* in patients, without immunoselection of variant tumor cells no longer expressing the Ag of choice. (See summary of Results and Discussion, page 317, Gordan et al. Universal tumor antigens as targets for immunotherapy, *Cytotherapy*, 4(4):317-27, 2002). Consistent with the teachings of Gordan et al., **Andersen et al.** teaches that advances in therapeutic tumor vaccinations necessitate the identification of broadly expressed, immunogenic tumor antigens that are not prone to immune selection. To this end, the human inhibitor of apoptosis, *survivin*, **is a prime candidate** because it is expressed in most human neoplasms but not in normal, differentiated tissues. Anderson et al. demonstrates spontaneous cytotoxic T-cell responses against survivin-derived MHC class I-restricted T-cell epitopes in breast cancer, leukemia, and melanoma patients both *in situ* as well as *ex vivo* (See abstract, Andersen et al., 2001).

(ii) Regarding CCL21/SLC (secondary lymphoid tissue chemokine) as a cytokine that specifically enhances T cell mediated immune response, **Luther et al.** teaches that a comparison of CCL19 transgenic mice with mice expressing CCL21 (secondary lymphoid tissue chemokine) revealed that CCL21 induced larger and more organized infiltrates, and a more significant role

Art Unit: 1632

for CCL21 is also suggested in lymphoid tissues, as CCL21 protein was found to be present in lymph nodes and spleen at much higher concentrations than CCL19 (See abstract, Luther et al., 2002). Luther et al. teaches that *a striking feature of the infiltrates in RIP-CCL21 transgenic mice was the localization of DCs (dendritic cells) and T cells, but not B cells, close to the chemokine-expressing islet cells*, which is exactly the opposing pattern has been previously observed in RIP-CXCL13 transgenic mice, where B cells line the islets and T cells are localized more distantly (See second paragraph, left column, page 426, Luther et al., 2002).

(iii) Regarding the limitation "DNA construct is incorporated in an attenuated *Salmonella typhimurium* vector that targets Peyer's patches in the gut" and the limitation "attenuated *Salmonella typhimurium* vector comprises an *aroA*<sup>-</sup> *dam*<sup>-</sup> *Salmonella typhimurium* strain", **Lu et al.** (1998) teaches the following statements: Attenuated *Salmonella typhimurium* has been proposed as one means of providing effective delivery of desired antigens. They provide the advantage that they can be delivered orally. The bacteria grow rapidly and do not require growth in cell culture. Thus, *large scale production of vectors, for example, in the use of vaccines, can be accomplished more quickly and easy then where mammalian tissue cultures are required*. After oral ingestion, *Salmonella* are concentrated within the liver, spleen, bone marrow, and the Peyers' patches of the gut-associated lymphoid tissue (GALT) (See Abstract, and lines 39-54, column 1, Lu et al., 1998). Lu et al. also teaches that by mutations in regions of a *phoP* regulatory region repressed gene (*prg*) or a *phoP* regulated activated genes (*pag*), preferably by a deletion, the *Salmonella* is rendered *less virulent*. Preferably, a second mutation in an aromatic amino acid synthetic gene, such as **aroA**, or *aroC/aroD* locus is made (See bridging paragraph, columns 5-6, Lu et al., 1998). Consistent with the teachings by Lu et al. **Xiang et al. (2001)**

Art Unit: 1632

teaches that peripheral T-cell tolerance toward human carcinoembryonic self-antigen (CEA) was broken in CEA-transgenic C57BL/6J mice by an oral CEA-based DNA vaccine. This vaccine, delivered by the live, attenuated AroA<sup>-</sup> strain of *Salmonella typhimurium* (SL7207), induced tumor-protective immunity mediated by MHC class I-restricted CD8<sup>+</sup> T cells. Additionally, in the context of reducing virulence of *Salmonella typhimurium* as a vector for DNA vaccine, **Dueger et al. (2001)** teaches that *Salmonella* DNA adenine methylase (Dam) mutants that lack Dam are highly attenuated for virulence in mice and confer protection against murine typhoid fever. Dueger et al. (2001) further teaches that a *Salmonella enterica* serovar Typhimurium **Dam<sup>-</sup>** vaccine strain was attenuated for virulence in day-of-hatch chicks more than 100,000-fold, and vaccination of chicks elicited cross-protective immune responses, as evidenced by reduced colonization (10- to 10,000-fold) of the gastrointestinal tract (ileum, cecum, and feces) and visceral organs (bursa and spleen) after challenge with homologous (Typhimurium F98) and heterologous (Enteritidis 4973 and *S. enterica* O6,14,24: e, h-monophasic) *Salmonella* serovars that are implicated in *Salmonella* infection of poultry (See abstract, Dueger et al, 2001).

Therefore, it would have been *prima facie* obvious to one having ordinary skill in the art at the time of the invention to generate a DNA vaccine construct to be incorporated into and orally delivered by attenuated aroA<sup>-</sup> dam<sup>-</sup> *Salmonella typhimurium* vector, as taught by Lu et al (1998), Xinag et al. (2001), and Dueger et al. (2001), via combined teachings of (i) Haupt et al regarding the induction of specific immune responses directed against antigens expressed in human tumor cells and displayed e.g., by MHC class I complexes via DNA vaccination of tumor specific antigen and cytokine, (ii) Gordan et al. regarding survivin is one of four of universal tumor Ags (hTERT, CYP1B1, survivin, and MDM2), and Andersen et al. regarding spontaneous

Art Unit: 1632

cytotoxic T-cell responses against survivin-derived MHC class I-restricted T-cell epitopes in breast cancer, leukemia, and melanoma patients both *in situ* as well as *ex vivo*, and (iii) Luther et al. regarding cytokine CCL21 specifically enhances T cell mediated immune response, to arrive at the claimed DNA vaccine that induces a cytotoxic T lymphocyte immune response against tumor cells when orally administering *aroA*<sup>-</sup> *dam*<sup>-</sup> *Salmonella typhimurium* comprising the DNA vaccine to a patient.

One having ordinary skill in the art would have been motivated to combine the teachings of Haupt et al. (2002) in view of Gordan et al. (2002), Andersen et al. (2001), Luther et al. (2002), Lu et al. (1998), Xinag et al. (2001), and Dueger et al. (2001), to achieve at a DNA vaccine that induces s cytotoxic T lymphocyte immune response against all tumors because (i) Haupt et al. teaches a DNA vaccine that induces cytotoxic T lymphocyte immune response by expressing various tumor associated antigens (TAAs), which are present in various tumors (i.e. non-universal TAA), and the effect of expression of cytokine in enhancing the efficacy of the DNA vaccine, (ii) Gordan et al. teaches survivin is one of four established universal tumor Ags (hTERT, CYP1B1, survivin, and MDM2), and Andersen et al. regarding spontaneous cytotoxic T-cell responses against survivin-derived MHC class I-restricted T-cell epitopes in breast cancer, leukemia, and melanoma patients both *in situ* as well as *ex vivo*, (iii) Luther et al. teaches cytokine CCL21, not cytokine CCL19, specifically enhances T cell mediated immune response, and (iv) Lu et al. (1998), Xiang et al. (2001), and Dueger et al. (2001) teach that the advantage of using *aroA*<sup>-</sup> *dam*<sup>-</sup> *Salmonella typhimurium* strain exhibiting attenuated virulence comprising the DNA vaccine as a vehicle for targeted delivery of antigen to Peyer's patches in the gut via oral delivery of *S. typhimurium*

Art Unit: 1632

There would have been a reasonable expectation of success given (i) successful demonstration of DNA vaccine delivered by gene gun with an expression plasmid encoding the human calcitonin precursor preprocalcitonin enables induction of antigen-specific cellular and humoral immune responses in mice, and co-delivery of a plasmid encoding GM-CSF increased the efficacy of this DNA vaccine, by the teachings of Haupt et al., (ii) successful identification and validation of survivin as one of four universal tumor associated antigens, by the teachings of Gordan et al., and demonstration of spontaneous cytotoxic T-cell responses against survivin-derived MHC class I-restricted T-cell epitopes in breast cancer, leukemia, and melanoma patients both *in situ* as well as *ex vivo*, by the teachings of Andersen et al., and (iii) successful demonstration of the effect of CCL21 in specifically increasing T cell mediated cytolytic response, by the teachings of Luther et al., (iv) successful generation of attenuated *Salmonella typhimurium* that can express exogenous antigens and the demonstration of using attenuated *Salmonella typhimurium* for oral vaccination, by the teachings of Lu et al., 1998, and (v) the advantages of using *aroA<sup>-</sup> dam<sup>-</sup> Salmonella typhimurium* strain as a DNA vaccine vector in terms of enhanced protective immune response and reduced virulence by the combined teachings of Lu et al. (1998), Xiang et al. (2001), and Dueger et al. (2001).

Thus, the claimed invention as a whole was clearly *prima facie* obvious.

3. Claim 26 remains rejected under 35 U.S.C. 103(a) as being unpatentable over **Haupt et al.** (Haupt et al., The potential of DNA vaccination against tumor-associated antigens for antitumor therapy, *Exp Biol Med (Maywood)*. 227(4):227-37, 2002) in view of **Gordan et al.** (Gordan et al. Universal tumor antigens as targets for immunotherapy, *Cytotherapy*, 4(4):317-27,

Art Unit: 1632

2002; this reference has been cited in the office action mailed on 04/25/2008), **Andersen et al.** (Andersen et al., Spontaneous cytotoxic T-cell responses against survivin-derived MHC class I-restricted T-cell epitopes in situ as well as ex vivo in cancer patients, *Cancer Res.* 61(16):5964-8, 2001), **Luther et al.** (Luther et al., Differing activities of homeostatic chemokines CCL19, CCL21, and CXCL12 in lymphocyte and dendritic cell recruitment and lymphoid neogenesis, *J Immunol.* 169(1):424-33, 2002; this reference has been cited in the office action mailed on 07/06/2007), **Lu et al.** (US 5,733,760, issued 03/31/1998; this reference has been cited in the office action mailed on 04/25/2008), **Xiang et al.** (Xinag et al., Protective immunity against human carcinoembryonic antigen (CEA) induced by an oral DNA vaccine in CEA-transgenic mice, *Clin Cancer Res.* 7(3 Suppl):856s-864s, 2001), and **Dueger et al.** (Dueger et al. *Salmonella* DNA adenine methylase mutants elicit protective immune responses to homologous and heterologous serovars in chickens, *Infect Immun.* 69(12):7950-4, 2001), as applied to claim 1 above, and further in view of **Bennett et al.** (Bennett et al. WO200157059-A1 and U.S. Patent No. 6,335,194, SEQ ID No: 10, columns 27, 53-55; this reference has been provided in the Non-Final office action mailed on 12/13/2006). Applicant's arguments filed 09/09/2010 have been fully considered and they are not persuasive. Previous rejection is ***maintained*** for the reasons of record advanced on pages 14-20 of the office action mailed on 05/11/2010.

For the clarity and completeness of this office action, the rejection for the reasons of record advanced on pages 14-20 of the office action mailed on 05/11/2010 is reiterated below, with editorial revisions.

Claim 1 filed on 09/09/2010 reads as follows: An oral DNA vaccine suitable for eliciting an immune response against cancer cells in a patient comprising a DNA construct operably encoding at least one survivin protein and one CCL21 cytokine in a pharmaceutically acceptable

Art Unit: 1632

carrier; wherein the DNA construct is incorporated in an attenuated *Salmonella typhimurium* vector that targets Peyer's patches in the gut, wherein the DNA vaccine induces a cytotoxic T-lymphocyte immune response against tumor cells when orally administered to the patient, and the attenuated *Salmonella typhimurium* vector comprises an *aroA*<sup>-</sup> *dam*<sup>-</sup> *Salmonella typhimurium* strain.

Claim 26 reads as follows: The DNA vaccine of claim 1 wherein the DNA construct operably encoding the survivin protein comprises SEQ ID NO: 3.

The teachings of Haupt et al., Gordan et al., Andersen et al., Luther et al., Lu et al., Xiang et al. and Dueger et al. have been discussed in the preceding section of the rejection of claim 1 under 35 U.S.C. 103(a) as being unpatentable over Haupt et al. (2002) in view of Gordan et al. (2002), Andersen et al. (2001), Luther et al. (2002), Lu et al. (1998), Xiang et al. (2001), and Dueger et al. (2001).

None of Haupt et al., Gordan et al., Andersen et al., Luther et al., Lu et al., Xiang et al., and Dueger et al. teaches SEQ ID No: 3 recited in claim 26.

However, at the time of filing of instant application, the DNA construct encoding a murine survivin protein comprising SEQ ID No. 3 recited in claim 26, was known in the art. For instant, **Bennett et al.** teach DNA encoding mouse survivin that identical to SEQ ID NO: 3 (See Bennett et al. WO200157059-A1 and U.S. Patent No. 6,335,194, SEQ ID No: 10, columns 27, 53-55, detailed alignment of sequences listed below)

CC The invention relates to antisense oligonucleotides targeted to a nucleic  
CC acid molecule encoding human Survivin, where the antisense  
CC oligonucleotide inhibits the expression of human Survivin. These  
CC antisense oligonucleotides are used in the treatment of an animal  
CC suffering from a disease or condition associated with Survivin, e.g. a  
CC hyperproliferative condition such as cancer, and comprises administering  
CC a therapeutically or prophylactically effective amount of the antisense  
CC oligonucleotide so that expression of Survivin is inhibited. The  
CC oligonucleotides can also be used to treat a human suffering from a  
CC disease or condition characterised by a reduction in apoptosis comprising  
CC administering the antisense oligonucleotide to a human. In addition, the  
CC antisense oligonucleotide and a cytotoxic chemotherapeutic agent e.g.  
CC taxol or cisplatin, can be used to modulate apoptosis, cytokinesis or the  
CC cell cycle, or inhibit the proliferation in a cancer cell by contacting  
CC the cell with the antisense oligonucleotide. AAS21521-AAS21768 represent  
CC Survivin nucleic acids, and antisense oligonucleotides targeted to  
CC Survivin, used in the method of the invention

```

Therefore, it would have been *prima facie* obvious to one having ordinary skill in the art at the time of the invention to incorporate the teachings of Bennett et al. on the DNA encoding mouse survivin, which is identical to SEQ ID NO: 3 recited in claim 26 of instant application, into the combined teachings of Haupt et al., Gordan et al., Andersen et al., Luther et al., Lu et al., Xiang et al., and Dueger et al. directing to a DNA vaccine suitable for eliciting a CTL immune response against cancer cells comprising a DNA construct operably encoding at least one survivin protein and at least one CCL21 cytokine in a pharmaceutically acceptable carrier;

Art Unit: 1632

wherein the DNA construct is incorporated in an attenuated *aroA<sup>-</sup> dam<sup>-</sup> Salmonella typhimurium* vector that targets Peyer's patches in the gut of a patient when the patient is orally vaccinated with the DNA construct.

One having ordinary skill in the art would have been motivated to incorporate the teachings of Bennett et al. on the DNA encoding mouse survivin, which is identical to SEQ ID NO: 3 recited in claim 26 of instant application, into the combined teachings of Haupt et al., Gordan et al., Andersen et al., Luther et al., Lu et al., Xiang et al. and Dueger et al. because survivin is conserved in mammals, universally expressed in tumor cells but not in other normal tissues, and SEQ ID No: 3 encodes mouse survivin.

There would have been a reasonable expectation of success given (i) successful demonstration of DNA vaccine delivered by gene gun with an expression plasmid encoding the human calcitonin precursor preprocalcitonin enables induction of antigen-specific cellular and humoral immune responses in mice, and co-delivery of a plasmid encoding GM-CSF increased the efficacy of this DNA vaccine, by the teachings of Haupt et al., (ii) successful identification and validation of survivin as one of four universal tumor associated antigens, by the teachings of Gordan et al. and demonstration of spontaneous cytotoxic T-cell responses against survivin-derived MHC class I-restricted T-cell epitopes in breast cancer, leukemia, and melanoma patients both *in situ* as well as *ex vivo*, by the teachings of Andersen et al., and (iii) successful demonstration of the effect of CCL21 in specifically increasing T cell mediated cytolytic response, by the teachings of Luther et al., and (iv) successful generation of attenuated *Salmonella typhimurium* that can express exogenous antigens and the demonstration of using attenuated *Salmonella typhimurium* for oral vaccination, by the teachings of Lu et al., 1998, (v)

Art Unit: 1632

the advantages of using *aroA<sup>-</sup> dam<sup>-</sup> Salmonella typhimurium* strain as a DNA vaccine vector in terms of enhanced protective immune response and reduced virulence by the combined teachings of Lu et al. (1998), Xiang et al. (2001), and Dueger et al. (2001), and (vi) DNA encoding mouse survivin was readily available by the teachings of Bennett et al.

Thus, the claimed invention as a whole was clearly *prima facie* obvious.

4. Claim 28 remains rejected under 35 U.S.C. 103(a) as being unpatentable over **Haupt et al.** (Haupt et al., The potential of DNA vaccination against tumor-associated antigens for antitumor therapy, *Exp Biol Med (Maywood)*. 227(4):227-37, 2002) in view of **Gordan et al.** (Gordan et al. Universal tumor antigens as targets for immunotherapy, *Cytotherapy*, 4(4):317-27, 2002; this reference has been cited in the office action mailed on 04/25/2008), **Andersen et al.** (Andersen et al., Spontaneous cytotoxic T-cell responses against survivin-derived MHC class I-restricted T-cell epitopes in situ as well as ex vivo in cancer patients, *Cancer Res.* 61(16):5964-8, 2001), **Luther et al.** (Luther et al., Differing activities of homeostatic chemokines CCL19, CCL21, and CXCL12 in lymphocyte and dendritic cell recruitment and lymphoid neogenesis, *J Immunol.* 169(1):424-33, 2002; this reference has been cited in the office action mailed on 07/06/2007), **Lu et al.** (US 5,733,760, issued 03/31/1998; this reference has been cited in the office action mailed on 04/25/2008), **Xiang et al.** (Xiang et al., Protective immunity against human carcinoembryonic antigen (CEA) induced by an oral DNA vaccine in CEA-transgenic mice, *Clin Cancer Res.* 7(3 Suppl):856s-864s, 2001), and **Dueger et al.** (Dueger et al. *Salmonella* DNA adenine methylase mutants elicit protective immune responses to homologous and heterologous serovars in chickens, *Infect Immun.* 69(12):7950-4, 2001) as applied to claim 1

Art Unit: 1632

above, and further in view of **Tanabe et al.** (Tanabe et al., direct submission, submitted to Genetics Institute, 87 Cambridge Park Drive, Cambridge, MA 02140, USA, on 03-JUN-1997, direct submission of DNA sequences of CCL21; this reference has been provided in the Non-Final office action mailed on 12/13/2006). Applicant's arguments filed 09/09/2010 have been fully considered and they are not persuasive. Previous rejection is ***maintained*** for the reasons of record advanced on pages 20-25 of the office action mailed on 05/11/2010.

For the clarity and completeness of this office action, the rejection for the reasons of record advanced on pages 20-25 of the office action mailed on 05/11/2010 is reiterated below, with editorial revisions.

Claim 1 filed on 09/09/2010 reads as follows: An oral DNA vaccine suitable for eliciting an immune response against cancer cells in a patient comprising a DNA construct operably encoding at least one survivin protein and one CCL21 cytokine in a pharmaceutically acceptable carrier; wherein the DNA construct is incorporated in an attenuated *Salmonella typhimurium* vector that targets Peyer's patches in the gut, wherein the DNA vaccine induces a cytotoxic T-lymphocyte immune response against tumor cells when orally administered to the patient, and the attenuated *Salmonella typhimurium* vector comprises an *aroA*<sup>-</sup> *dam*<sup>-</sup> *Salmonella typhimurium* strain.

Claim 28 reads as follows: The DNA vaccine of claim 1 wherein the DNA construct operably encoding the CCL21 cytokine comprises SEQ ID NO: 7.

The teachings of Haupt et al., Gordan et al., Andersen et al., Luther et al., Lu et al., Xiang et al. and Dueger et al. have been discussed in the preceding section of the rejection of claim 1 under 35 U.S.C. 103(a) as being unpatentable over Haupt et al. (2002) in view of Gordan et al. (2002), Andersen et al. (2001), Luther et al. (2002), Lu et al. (1998), Xiang et al. (2001), and Dueger et al. (2001).

Art Unit: 1632

None of Haupt et al., Gordan et al., Andersen et al., Luther et al., Lu et al., Xiang et al., and Dueger et al. teaches SEQ ID No:7 recited in claim 28.

However, at the time of filing of instant application, the DNA construct encoding a murine survivin protein comprising SEQ ID No. 7 recited in claim 28, was known in the art. For instant, **Tanabe et al.** teach DNA encoding mouse CCL21 that is identical SEQ ID NO: 7 (Tanabe et al., direct submission, submitted to Genetics Institute, 87 Cambridge Park Drive, Cambridge, MA 02140, USA, on 03-JUN-1997, detailed alignment of sequences listed below; this reference has been provided in the Non-Final office action mailed on 12/13/2006).

Therefore, it would have been *prima facie* obvious to one having ordinary skill in the art at the time of the invention to incorporate the teachings of Tanabe et al. on the DNA encoding mouse survivin, which is identical to SEQ ID NO: 7 recited in claim 28 of instant application, into the combined teachings of Haupt et al., Gordan et al., Anderson et al., Luther et al., Lu et al., Xiang et al., and Dueger et al. directing to a DNA vaccine suitable for eliciting a CTL immune response against cancer cells comprising a DNA construct operably encoding at least one survivin protein and at least one CCL21 cytokine in a pharmaceutically acceptable carrier; wherein the DNA construct is incorporated in an attenuated *aroA<sup>-</sup> dam<sup>-</sup> Salmonella typhimurium*

Art Unit: 1632

vector that targets Peyer's patches in the gut of a patient when the patient is orally vaccinated with the DNA construct.

One having ordinary skill in the art would have been motivated to incorporate the teachings of Tanabe et al. on the DNA encoding mouse survivin, which is identical to SEQ ID NO: 7 recited in claim 28 of instant application, into the combined teachings of Haupt et al., Gordan et al., Andersen et al., Luther et al., Lu et al., Xiang et al., and Dueger et al. because cytokine CCL21 is known to specifically enhance T cell mediated immune response, and SEQ ID No: 7 encodes mouse CCL21.

There would have been a reasonable expectation of success given (i) successful demonstration of DNA vaccine delivered by gene gun with an expression plasmid encoding the human calcitonin precursor preprocalcitonin enables induction of antigen-specific cellular and humoral immune responses in mice, and co-delivery of a plasmid encoding GM-CSF increased the efficacy of this DNA vaccine, by the teachings of Haupt et al., (ii) successful identification and validation of survivin as one of four universal tumor associated antigens, by the teachings of Gordan et al. and demonstration of spontaneous cytotoxic T-cell responses against survivin-derived MHC class I-restricted T-cell epitopes in breast cancer, leukemia, and melanoma patients both *in situ* as well as *ex vivo*, by the teachings of Andersen et al., and (iii) successful demonstration of the effect of CCL21 in specifically increasing T cell mediated cytolytic response, by the teachings of Luther et al., (iv) successful generation of attenuated *Salmonella typhimurium* that can express exogenous antigens and the demonstration of using attenuated *Salmonella typhimurium* for oral vaccination, by the teachings of Lu et al., 1998, (v) the advantages of using *aroA*<sup>-</sup> *dam*<sup>-</sup> *Salmonella typhimurium* strain as a DNA vaccine vector in terms

Art Unit: 1632

of enhanced protective immune response and reduced virulence by the combined teachings of Lu et al. (1998), Xiang et al. (2001), and Dueger et al. (2001), and (vi) DNA encoding mouse CCL21 was readily available by the teachings of Tanabe et al.

Thus, the claimed invention as a whole was clearly *prima facie* obvious.

5. Claim 53 remains rejected under 35 U.S.C. 103(a) as being unpatentable over **Haupt et al.** (Haupt et al., The potential of DNA vaccination against tumor-associated antigens for antitumor therapy, *Exp Biol Med (Maywood)*. 227(4):227-37, 2002) in view of **Gordan et al.** (Gordan et al. Universal tumor antigens as targets for immunotherapy, *Cytotherapy*, 4(4):317-27, 2002; this reference has been cited in the office action mailed on 04/25/2008), **Andersen et al.** (Andersen et al., Spontaneous cytotoxic T-cell responses against survivin-derived MHC class I-restricted T-cell epitopes in situ as well as ex vivo in cancer patients, *Cancer Res.* 61(16):5964-8, 2001), **Luther et al.** (Luther et al., Differing activities of homeostatic chemokines CCL19, CCL21, and CXCL12 in lymphocyte and dendritic cell recruitment and lymphoid neogenesis, *J Immunol.* 169(1):424-33, 2002; this reference has been cited in the office action mailed on 07/06/2007), **Lu et al.** (US 5,733,760, issued 03/31/1998; this reference has been cited in the office action mailed on 04/25/2008), **Xiang et al.** (Xinag et al., Protective immunity against human carcinoembryonic antigen (CEA) induced by an oral DNA vaccine in CEA-transgenic mice, *Clin Cancer Res.* 7(3 Suppl):856s-864s, 2001), and **Dueger et al.** (Dueger et al. *Salmonella* DNA adenine methylase mutants elicit protective immune responses to homologous and heterologous serovars in chickens, *Infect Immun.* 69(12):7950-4, 2001) as applied to claim 1 above, and further in view of **Bennett et al.** (Bennett et al. WO200157059-A1 and U.S. Patent

Art Unit: 1632

No. 6,335,194, SEQ ID No: 10, columns 27, 53-55; this reference has been provided in the Non-Final office action mailed on 12/13/2006), and **Tanabe et al.** (Tanabe et al., direct submission, submitted to Genetics Institute, 87 Cambridge Park Drive, Cambridge, MA 02140, USA, on 03-JUN-1997, direct submission of DNA sequences of CCL21; this reference has been provided in the Non-Final office action mailed on 12/13/2006). Applicant's arguments filed 09/09/2010 have been fully considered and they are not persuasive. Previous rejection is ***maintained*** for the reasons of record advanced on pages 25-29 of the office action mailed on 05/11/2010.

For the clarity and completeness of this office action, the rejection for the reasons of record advanced on pages 25-29 of the office action mailed on 05/11/2010 is reiterated below, with editorial revisions.

Claim 1 filed on 09/09/2010 reads as follows: An oral DNA vaccine suitable for eliciting an immune response against cancer cells in a patient comprising a DNA construct operably encoding at least one survivin protein and one CCL21 cytokine in a pharmaceutically acceptable carrier; wherein the DNA construct is incorporated in an attenuated *Salmonella typhimurium* vector that targets Peyer's patches in the gut, wherein the DNA vaccine induces a cytotoxic T-lymphocyte immune response against tumor cells when orally administered to the patient, and the attenuated *Salmonella typhimurium* vector comprises an aroA<sup>-</sup> dam<sup>-</sup> *Salmonella typhimurium* strain.

Claim 53 reads as follows: The DNA vaccine of claim 1 wherein the DNA construct operably encoding the survivin protein comprises SEQ ID NO: 3, and wherein the DNA construct operably encoding the CCL21 cytokine comprises SEQ ID NO: 7.

The teachings of Haupt et al., Gordan et al., Andersen et al., Luther et al., Lu et al., Xiang et al., and Dueger et al. have been discussed in the preceding section of the rejection of claim 1 under 35 U.S.C. 103(a) as being unpatentable over Haupt et al. (2002) in view of Gordan et al.

Art Unit: 1632

(2002), Andersen et al. (2001), Luther et al. (2002), Lu et al. (1998), Xiang et al. (2001), and Dueger et al. (2001).

None of Haupt et al., Gordan et al., Andersen et al., Luther et al., Lu et al., Xiang et al., and Dueger et al. teaches SEQ ID No:3 and SEQ ID No: 7 recited in claim 53.

However, at the time of filing of instant application, the DNA construct encoding a murine survivin protein comprising SEQ ID No. 3, the DNA construct encoding mouse CCL21 comprising SEQ ID No: 7, recited in claim 53, were known in the art. For instant, **Bennett et al.** teaches DNA encoding mouse survivin that identical to SEQ ID NO: 3 (See Bennett et al. WO200157059-A1 and U.S. Patent No. 6,335,194, SEQ ID No: 10, columns 27, 53-55, see detailed alignment of sequences listed in the preceding rejection #7), and **Tanabe et al.** teaches DNA encoding mouse CCL21 that is identical SEQ ID NO: 7 (Tanabe et al., direct submission, submitted to Genetics Institute, 87 Cambridge Park Drive, Cambridge, MA 02140, USA, on 03-JUN-1997, detailed alignment of sequences listed in the preceding rejection #8)

Therefore, it would have been *prima facie* obvious to one having ordinary skill in the art at the time of the invention to incorporate the teachings of Bennett et al. on the DNA encoding mouse survivin, which is identical to SEQ ID NO: 3, and the teachings of Tanabe et al. on the DNA encoding mouse CCL21, which is identical to SEQ ID NO: 7, as recited in claim 53 of instant application, into the combined teachings of Haupt et al., Gordan et al., Andersen et al., Luther et al., Lu et al., Xiang et al., and Dueger et al. directing to a DNA vaccine suitable for eliciting a CTL immune response against cancer cells comprising a DNA construct operably encoding at least one survivin protein and at least one CCL21 cytokine in a pharmaceutically acceptable carrier; wherein the DNA construct is incorporated in an attenuated aroA<sup>-</sup> dam<sup>-</sup>

Art Unit: 1632

*Salmonella typhimurium* vector that targets Peyer's patches in the gut of a patient when the patient is orally vaccinated with the DNA construct.

One having ordinary skill in the art would have been motivated to incorporate the teachings of Bennett et al. on the DNA encoding mouse survivin, which is identical to SEQ ID NO: 3, and the teachings of Tanabe et al. on the DNA encoding mouse CCL21, which is identical to SEQ ID NO: 7, as recited in claim 53 of instant application, into the combined teachings of Haupt et al., Gordan et al., Andersen et al., Luther et al., Lu et al., Xiang et al. and Dueger et al. because (i) survivin is conserved in mammals, universally expressed in tumor cells but not in other normal tissues, and SEQ ID No: 3 encodes mouse survivin, and (ii) cytokine CCL21 is known to specifically enhance T cell mediated immune response, and SEQ ID No: 7 encodes mouse CCL21.

There would have been a reasonable expectation of success given (i) successful demonstration of DNA vaccine delivered by gene gun with an expression plasmid encoding the human calcitonin precursor preprocalcitonin enables induction of antigen-specific cellular and humoral immune responses in mice, and co-delivery of a plasmid encoding GM-CSF increased the efficacy of this DNA vaccine, by the teachings of Haupt et al., (ii) successful identification and validation of survivin as one of four universal tumor associated antigens, by the teachings of Gordan et al. and demonstration of spontaneous cytotoxic T-cell responses against survivin-derived MHC class I-restricted T-cell epitopes in breast cancer, leukemia, and melanoma patients both *in situ* as well as *ex vivo*, by the teachings of Andersen et al., and (iii) successful demonstration of the effect of CCL21 in specifically increasing T cell mediated cytolytic response, by the teachings of Luther et al., (iv) successful generation of attenuated *Salmonella*

Art Unit: 1632

*typhimurium* that can express exogenous antigens and the demonstration of using attenuated *Salmonella typhimurium* for oral vaccination, by the teachings of Lu et al., 1998, (v) the advantages of using *aroA<sup>-</sup> dam<sup>-</sup> Salmonella typhimurium* strain as a DNA vaccine vector in terms of enhanced protective immune response and reduced virulence by the combined teachings of Lu et al. (1998), Xiang et al. (2001), and Dueger et al. (2001), and (vi) DNA construct encoding mouse survivin and DNA construct encoding mouse CCL21 were readily available by the teachings of Bennett et al. and Tanabe et al.

Thus, the claimed invention as a whole was clearly *prima facie* obvious.

***Applicant's arguments and Response to Applicant's arguments***

(I) Applicant states that to establish a *prima facie* case of obviousness, the Patent and Trademark Office bears the burden of satisfying three requirements. First, as the U.S. Supreme Court recently held in *KSR International Co. v. Teleflex Inc.* 82USPQ2d 1385 (2007):

[A] court must ask whether the improvement is more than the predictable use of prior art elements according to their established functions .... it [may] be necessary for a court to look to interrelated teachings of multiple patents; the effects of demands known to the design community or present in the marketplace; and the background knowledge possessed by a person having ordinary skill in the art, all in order to determine whether there was an apparent reason to combine the known elements in the thshion claimed by the patent at issue .... it can be important to identify a reason that would have prompted a person of ordinary skill in the relevant field to combine the elements in the way the claimed new invention does., because inventions in most, if not all, instances rely upon building blocks long since uncovered, and claimed discoveries almost of necessity will be combinations of what, in some sense, is already known." Id. at 1396.

Art Unit: 1632

Applicant states that secondly, the proposed modification of the prior art must have had a reasonable expectation of success, determined from the vantage point of the skilled artisan at the time the invention was made. *Amgen Inc. v. Chugai Pharm. Co.*, 18 USPQ 1016, 1023 (C.C.P.A. 1970). Applicant states that thirdly, all words in a claim must be considered in judging the patentability of that claim against the prior art. *In re Wilson*, 165 USPQ 494, 496 (C.C.P.A. 1970). In addition, a reference should be considered for all that it would have fairly suggested to those of ordinary skill in the art, not just those parts that would support a conclusion of obviousness (see e.g., *Bausch & Lomb, Inc. v. Barnes- Hind/Hydrocurve, Inc.*, 230 USPQ 416 (Fed. Cir. 1986)).

Applicant argues that Haupt et al. provide a review of potential strategies for DNA vaccination against tumor-associated antigens for anti-tumor therapy. This reference discusses a number of advantages and difficulties associated with DNA vaccination against tumor-associated antigens. In particular, this reference points out that all tumor antigens being expressed tissue specifically could be possible targets for DNA vaccines if the expressing tissue is not essential for health and survival (p. 233, col. 1). Peyer's patches, however, play a vital role in the immune response against microorganisms and are essential to health and survival. Thus, this reference teaches that the results of targeting a given tumor-associated antigen are limited to specific types of tissues and based on the teaching away in Haupt et al. it would not have been obvious to introduce the DNA vaccine orally to specifically target Peyer's patches in the gut. Furthermore, the example referred to by the Examiner (Current Action p. 7) does not address any malignant tumor of epithelial origin as suggested by the Examiner, but specifically to medullary thyroid carcinomas as expressing calcitonin. There is no reasonable expectation that a process that shows a certain result against medullary thyroid carcinoma would have a similar effect against a tumor in the lower intestines. Lastly, at page 229, col. 1 through page 230, col. 2 the reference discloses a number of methods for delivering a DNA vaccine (e.g., intravenous, intramuscular, and aerosol). Significantly, none of those methods involves oral delivery, much less oral delivery in an attenuated *S. typhimurium* vector as claimed (See pages 3-5 of Applicant's remarks file don 09/09/2010).

Art Unit: 1632

***In response***, Applicant is reminded that the maintained rejection is a 103 rejection, not a 102 rejection. In this regard, one cannot show nonobviousness by attacking references *individually* where the rejections are based on combinations of references. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); *In re Merck & Co.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986).

With regard to asserted requirement for explicit suggestion and motivation disclosed by prior arts, the Examiner would like to direct Applicant's attention to recent decision by U.S. Supreme Court in *KSR International Co. v. Teleflex, Inc.* that forecloses the argument that a **specific** teaching, suggestion, or motivation is an absolute requirement to support a finding of obviousness. See recent Board decision *Ex parte Smith*, --USPQ2d--, slip op. at 20, (Bd. Pat. App. & Interf. June 25, 2007) (citing KSR, 82 USPQ2d at 1936) (available at <http://www.uspto.gov/web/offices/dcom/bpai/prec/fd071925.pdf>). The Examiner notes that in the instant case, even in the absence of recent decision by U.S. Supreme Court in *KSR International Co. v. Teleflex, Inc.*, the suggestion and motivation to combine Haupt et al., Gordan et al., Andersen et al., Luther et al., Lu et al., Xiang et al., and Dueger et al. (and further in view of Bennett et al. and/or Tanabe et al.) have been clearly set forth above in this office action.

It is worth noting that elaboration of claim interpretations have been documented in this office action: **(I)** The word/phrase “oral” and “suitable for eliciting an immune response against cancer cells in a patient” recited in the preamble of claim 1 is the intended use of claimed “DNA vaccine”, which is a product. For prior art rejection, the components of claimed product bear patentable weight whereas the intended use of the product bears limited, if any, patentable weight, See MPEP 2111.03. Intended used does not impart patentable weight to a product. MPEP 2111.03: Intended use recitations and other types of functional language cannot be entirely disregarded. However, in apparatus, article, and composition claims, intended use must result in a structural difference between the claimed invention and the prior art in order to patentably distinguish the claimed invention from the prior art. If the prior art structure is capable of performing the intended use, then it meets the claim. In a claim drawn to a process of making, the intended use must result in a manipulative difference as compared to the prior art. *In re Casey* 370 F.2d 576, 152 USPQ 235 (CCPA 1967); *In re Otto*, 312 F.2d 937, 938, 136

Art Unit: 1632

USPQ 458, 459, (CCPA 1963). **(II)** The phrase “a patient” of the limitation “an immune response against cancer cells in a patient” recited in independent claim 1 encompasses *any* patient cared by a physician for human patient or cared by a veterinarian for any non-human mammal. This interpretation **(i)** is based on the limitation “survivin protein comprises SEQ ID NO: 3” recited in dependent claims 26 and 53, and SEQ ID NO: 3 is a *mouse* survivin protein, and “the CCL21 cytokine comprises SEQ ID NO: 7” recited in dependent claims 28 and 53 and SEQ ID NO: 7 is a *mouse* CCL21 protein, and **(ii)** is consistent with the status of art at the time of filing as evident by the prior arts cited in this maintained rejection. **(III)** The phrase “immune response” of the limitation “an immune response against cancer cells in a patient” recited in independent claim 1 encompasses any immune response which comprises “a cytotoxic T-lymphocyte immune response” against tumor cells when orally administered to the patient. **(IV)** The limitation “induces a cytotoxic T-lymphocyte immune response against tumor cells *when* orally administered to the patient” recited in claim 1 encompasses **(i)** a comparison of level of a cytotoxic T-lymphocyte immune response in a patient between oral administration and any other non-oral administration of the same DNA construct encoding at least a survivin protein and one CCL21 cytokine, and **(ii)** a comparison of level of a cytotoxic T-lymphocyte immune response between orally administered DNA construct encoding at least a surviving protein and one CCL21 cytokine and any other orally administered control DNA construct, which for instance includes DNA construct encoding survivin protein, but not encoding a CCL21 cytokine.

Applicant’s arguments “Peyer's patches, however, play a vital role in the immune response against microorganisms and are essential to health and survival. Thus, this reference teaches that the results of targeting a given tumor-associated antigen are limited to specific types of tissues and based on the teaching away in Haupt et al. it would not have been obvious to introduce the DNA vaccine orally to specifically target Peyer's patches in the gut. Furthermore, the example referred to by the Examiner (Current Action p. 7) does not address any malignant tumor of epithelial origin as suggested by the Examiner, but specifically to medullary thyroid carcinomas as expressing calcitonin” have been fully considered and found not persuasive. The Examiner notes that claim interpretations **(I)** and **(IV)** listed above are relevant to Applicant’s arguments. Moreover, it is emphasized that the maintained rejection specifically states that

Art Unit: 1632

Haupt et al. does not explicitly teach “a DNA construct been incorporated in an attenuated *Salmonella typhimurium* vector that targets Peyer's patches in the gut, and the attenuated *Salmonella typhimurium* vector comprises an aroA<sup>-</sup> dam<sup>-</sup> *Salmonella typhimurium* strain”. In this regard the maintained rejection specifically documented that regarding the limitation “DNA construct is incorporated in an attenuated *Salmonella typhimurium* vector that targets Peyer's patches in the gut” and the limitation “attenuated *Salmonella typhimurium* vector comprises an aroA<sup>-</sup> dam<sup>-</sup> *Salmonella typhimurium* strain”, **Lu et al.** (1998) teaches the following statements: Attenuated *Salmonella typhimurium* has been proposed as one means of providing effective delivery of desired antigens. They provide the advantage that they can be delivered orally. The bacteria grow rapidly and do not require growth in cell culture. Thus, ***large scale production of vectors, for example, in the use of vaccines, can be accomplished more quickly and easy then where mammalian tissue cultures are required.*** After oral ingestion, *Salmonella* are concentrated within the liver, spleen, bone marrow, and the Peyers' patches of the gut-associated lymphoid tissue (GALT) (See Abstract, and lines 39-54, column 1, Lu et al., 1998). Lu et al. also teaches that by mutations in regions of a phoP regulatory region repressed gene (prg) or a phoP regulated activated genes (pag), preferably by a deletion, the *Salmonella* is rendered *less virulent*. Preferably, a second mutation in an aromatic amino acid synthetic gene, such as aroA, or aroC/aroD locus is made (See bridging paragraph, columns 5-6, Lu et al., 1998). Consistent with the teachings by Lu et al. **Xiang et al. (2001)** teaches that peripheral T-cell tolerance toward human carcinoembryonic self-antigen (CEA) was broken in CEA-transgenic C57BL/6J mice by an oral CEA-based DNA vaccine. This vaccine, delivered by the live, attenuated AroA<sup>-</sup> strain of *Salmonella typhimurium* (SL7207), induced tumor-protective immunity mediated by MHC class I-restricted CD8<sup>+</sup> T cells. Additionally, in the context of reducing virulence of *Salmonella typhimurium* as a vector for DNA vaccine, **Dueger et al. (2001)** teaches that *Salmonella* DNA adenine methylase (Dam) mutants that lack Dam are highly attenuated for virulence in mice and confer protection against murine typhoid fever. Dueger et al. (2001) further teaches that a *Salmonella enterica* serovar Typhimurium **Dam<sup>-</sup>** vaccine strain was attenuated for virulence in day-of-hatch chicks more than 100,000-fold, and vaccination of chicks elicited cross-protective immune responses, as evidenced by reduced colonization (10- to 10,000-fold) of the gastrointestinal tract (ileum, cecum, and feces) and visceral organs (bursa and spleen) after

Art Unit: 1632

challenge with homologous (Typhimurium F98) and heterologous (Enteritidis 4973 and *S. enterica* O6,14,24: e, h-monophasic) *Salmonella* serovars that are implicated in *Salmonella* infection of poultry (See abstract, Dueger et al, 2001).

Consistent with the discussions provided in the preceding paragraph, Applicant's arguments "the results of targeting a given tumor-associated antigen are limited to specific types of tissues and based on the teaching away in Haupt et al." have been fully considered and found not persuasive. The Examiner note that nowhere in the teachings by Haupt et al. indicates survivin, which is an universal tumor antigen taught by Gordan et al., cannot induce any immune response in any tissue as broadly encompassed by the intended use of claimed DNA vaccine. Furthermore, consistent with the teachings of Gordan et al., Andersen et al. specifically teaches spontaneous cytotoxic T-cell responses against survivin-derived MHC class I-restricted T-cell epitopes *in situ* as well as *ex vivo* in cancer patients

(II) Applicant argued that Gordan et al. discloses that survivin is a good candidate for a universal TAA, some of the qualities needed by an ideal universal TAA have been identified in survivin. There is the possibility of survivin expression in normal tissues (p. 322, col. 2). Although survivin was identified as a strong candidate, it is not a foregone conclusion that it would be a successful target for DNA vaccination. Gordan et al. expressly states there is no basis for predicting survivin will be a functional tumor *rejection* antigen (p. 323, col. 2) (See page 5 of Applicant's remarks filed on 09/09/2010).

***In response***, for the clarity of record, the relevant teachings of taught by Gordan, including Table 1, are provided below.

"Having noted this, however, there is no basis currently for predicting whether any of these universal TAA will be functional tumor *rejection* Ags. None of them was directly derived based on patient reactivity (the data on surviving notwithstanding), nor is there extensive clinical experience with them at this time. One way to answer this question would be to determine the affinity of the T-cell receptors found on specific CTL from *in vitro* stimulations. These studies have not yet been extensively performed".

Art Unit: 1632

The Examiner notes that the claimed DNA vaccine does not require survivin to be “functional tumor *rejection* Ags”. The claimed DNA vaccine only requires “eliciting an immune response”. Furthermore, pertaining to “eliciting an immune response”, Table 1 of Gordan et al. shows that survivin is rarely expressed in normal tissue and is available in T-cell repertoire, and with characteristics of immune recognition by patients at baseline.

**Table 1.** Universal tumor antigens in comparison to other prototypic antigens

| Antigen        | Expressed in<br>> 50% of tumors | Expressed in<br>normal tissue | Required for<br>oncogenesis or<br>carcinogenesis | Available<br>T-cell<br>repertoire | Immune<br>recognition<br>by patients<br>at baseline |
|----------------|---------------------------------|-------------------------------|--|-----------------------------------|---|
| hTERT          | Yes                             | Rare cells                    | Yes  | Yes                               | No  |
| Survivin       | Yes                             | Rare cells                    | Yes  | Yes                               | Yes   |
| MDM2           | Yes                             | Low                           | Possibly   | No                                | No  |
| CYP1B1         | Yes                             | Rare cells                    | Yes  | Yes                               | No  |
| Melan-A/MART-1 | No                              | Pigmented cells               | No   | Yes                               | Yes   |
| NY-ESO-1       | No                              | Gonadal tissue                | No   | Yes                               | Yes   |
| p53            | Yes                             | Yes                           | Possibly   | Yes                               | Yes   |

(III) Applicant argues that **Lu et al.** teaches the use of an attenuated *Salmonella typhimurium* vector for oral delivery of antigens. None of the other applied references teaches or even suggests use of oral delivery or the use of *S. typhimurium* (See page 5 of Applicant’s remarks filed on 09/09/2010).

**In response**, the Examiner notes that the limitation “induces a cytotoxic T-lymphocyte immune response against tumor cells *when* orally administered to the patient” recited in claim 1 does not require oral administration being the only route for administration of claimed DNA vaccine. This has been elaborated in the *claim interpretations* (II). In this regard, Haupt et al. specifically discusses “Routes of Delivery of DNA Vaccines in Antitumor Therapy” (See bridging paragraph, pages 229-230, Haupt et al.).

Art Unit: 1632

(IV) Applicant argues that **Dueger et al.** teaches dam *Salmonella* immunization as effective against other *Salmonella* strains, murine typhoid fever, and suggests protection against other proteobacteria pathogens. There is no suggestion of treatment or prevention of cancer (See page 5 of Applicant's remarks filed on 09/09/2010).

*In response*, the Examiner notes that the claimed DNA vaccine is "suitable for eliciting an immune response against cancer cells". The claims are not directed to methods of treatment or prevention of cancer as Applicant argued. The combined teachings of cited prior arts certainly teach the structures of claimed DNA vaccine and the potential efficacy of claimed DNA vaccine for intended use in treating or preventing any cancer are characteristics inherent to the structures of claimed DNA vaccine.

(V) Applicant argues that the rejections at most amount to nothing more than an assertion that it would have been "obvious to try" the claimed combination in view of the isolated prior art teachings of the various elements of the claims. Applicant argues that the present invention does not represent a *predictable* variation of known (See page 6 of Applicant's remarks filed on 09/09/2010).

*In response*, the Examiner notes that, with regard to the selection of survivin as a component of claimed DNA vaccine, **Andersen et al.** teaches that advances in therapeutic tumor vaccinations necessitate the identification of broadly expressed, immunogenic tumor antigens that are not prone to immune selection. To this end, the human inhibitor of apoptosis, ***survivin***, ***is a prime candidate*** because it is expressed in most human neoplasms but not in normal, differentiated tissues. Anderson et al. demonstrates spontaneous cytotoxic T-cell responses against survivin-derived MHC class I-restricted T-cell epitopes in breast cancer, leukemia, and melanoma patients both *in situ* as well as *ex vivo* (See abstract, Andersen et al., 2001). With regard to the selection of CCL21 as a component of claimed DNA vaccine, **Luther et al.** teaches that ***a striking feature of the infiltrates in RIP-CCL21 transgenic mice was the localization of DCs (dendritic cells) and T cells, but not B cells, close to the chemokine-expressing islet cells***, which is exactly the opposing pattern has been previously observed in RIP-CXCL13 transgenic mice, where B cells line the islets and T cells are localized more distantly (See second paragraph,

Art Unit: 1632

left column, page 426, Luther et al., 2002). The specific teachings by Andersen et al. and Luther et al. provide strong motivation to combine the recited references, therefore, the maintained rejection is not based on the “obvious to try” rationale as Applicant argued. There is nothing unpredictable regarding the structure of claimed DBA vaccine, and again the potential efficacy of claimed DNA vaccine for intended use in treating or preventing any cancer are characteristics inherent to the structures of claimed DNA vaccine.

### ***Conclusion***

6. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

7. No claim is allowed.

Applicant is reminded that upon the cancellation of claims to a non-elected invention, the inventorship must be amended in compliance with 37 CFR 1.48(b) if one or more of the currently named inventors is no longer an inventor of at least one claim remaining in the

Art Unit: 1632

application. Any amendment of inventorship must be accompanied by a request under 37 CFR 1.48(b) and by the fee required under 37 CFR 1.17(i).

Any inquiry concerning this communication from the examiner should be directed to Wu-Cheng Winston Shen whose telephone number is (571) 272-3157 and Fax number is 571-273-3157. The examiner can normally be reached on Monday through Friday from 8:00 AM to 4:30 PM. If attempts to reach the examiner by telephone are unsuccessful, the supervisory patent examiner, Peter Paras, Jr. can be reached on (571) 272-4517. The fax number for TC 1600 is (571) 273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
